

Digital Art Commission & Watermarking Portal

Layered Component Architecture · Problem Statement #58 · Vivian Sobers E (PES1UG24CS901)

Notation

- Provided interface (ball) — service a component offers
- ⌋ Required interface (socket) — service a component needs
- Assembly connector — socket consumes the ball it cups

Key architectural constraint

Every draft leaves the Watermarking Engine before the Portal UI can render it, and the Asset Repository issues a signed URL for the watermark-free master only after the Payment Service has recorded a gateway authorization for that milestone. The Presentation Layer never reaches the Data Layer directly.
